Hi,

I wonder if someone can help me.

We have a W2k domain, and have purchased a couple of XP laptops.

For some strange reason, GPO do not seem to apply to the XP laptops when a Domain User logs on.

However, if any of the Domain Administrators log onto the Laptop. The GPO works with no problems.

When a Domain User logs on to the XP laptop, the following errors are logged in the Event Log..

Source: Userenv

Event ID: 1101

Description: Windows cannot access the object

OU=Users,OU=??,DC=??,DC=org.... in Active Directory. The access to the object may be denied. Group Policy Processing Aborted

The same Domain users can log onto the network with their old w2k machines, and the GPO applies with no problems. The problem seems to be with XP...

Regards...
