Your new P4 2.8GHz CPU supports hyper-threading and is being reported correctly.

Windows XP and Hyper-Threading

| Ok, I recently changed my CPU in my PC. I was able to boot
| up my computer fine and my new processor was detected fine
| by both my motherboard and WinXP, except, WinXP thinks
| that I have two of them. My motherboard doesn't even have
| two slots. The processor is supported by my motherboard.
| As far as I know it has no real effect on performance, but
| it's just something I want to get rid of if possible. I
| am not used to having two CPU monitoring graphs in the
| task manager, heh. I have tried uninstalling one of the
| two processors (the second one it thinks I have is labeled
| identical to the first and is the correct processor I am
| using) but WinXP won't let me, it just never goes off of
| the list. I have the most recent motherboard drivers and
| my bios settings are all correct. When I boot up my
| computer it only detects one processor and it is the
| correct one. My specs are as follows:

| Processor: P4 2.8GHz, 800MHz FSB, HT Tech, Prescott make
| Motherboard: ASRock P4S55FX+
| RAM: 512 DDR SDRAM PC2100
| OS: Windows XP Home SPK 1a

| Don't think anything else I have would be necessary to
| list.
