Is there a display card independent utility to create a virtual desktop larger than the actual display resolution?

This would be handy for coaxing higher resolution out of apps when I do a screen capture. E.g. streets and trips.

For this purpose, I don't care if the display performance is sluggish. I just want to be able to set a virtual desktop size (e.g. 4000x3000), maximize the app, do a screen capture, and paste the clipboard into photoshop.
