When using winrar du unrar large files (ex. 4GB) winrar only uses around 20% of the CPU power. Therefore a 4 GB file takes 25 hours to unrar.

Winrar is the only program running. I have installed newest bios on my Asus P4S8X-X motherboard, newest ide driver etc. But nothing has increased the unrar speed.

does anyone have any suggestions as to how i can make unrar use more cpu power (and reduce unrar time) ?

Any help will be much appreciated.

PS. I hope this is the correct newsgroup ?
