Hi Participants,

After running the disk error checking for my C: partition (can't run it immediately, have to restart the computer), I can check the application event log to read the results. For my backup partition, however, ("H:" – it's a logical partition), I can run the disk error checking immediately, but there doesn't seem to be a corresponding application event log for this. Both partitions are on the same hard drive.

How can I verify that my H: partition has really been checked if there is no application event log to review?

Is there something that I'm not understanding correctly about the disk error checking?

Thanks for your feedback in advance.

Leslie
