Hi,

I downloaded the XP service pack 2. When I try to validate html files using the W3C Markup Validation Service, I get this message when using Internet Explorer:

"Sorry, I am unable to validate this document because its content type is text/plain, which is not currently supported by this service.

The Content-Type field is sent by your web server (or web browser if you use the file upload interface) and depends on its configuration. Commonly, web servers will have a mapping of filename extensions (such as ".html") to MIME Content-Type values (such as text/html).

That you recieved this message can mean that your server is not configured correctly, that your file does not have the correct filename extension, or that you are attempting to validate a file type that we do not support yet. In the latter case you should let us know that you need us to support that content type (please include all relevant details, including the URL to the standards document defining the content type) using the instructions on the Feedback Page. "

When validating the same file in FireFox I have no problem.

How can I get the validation service to work with Internet Explorer again.

I have tried turning off the windows firewall and it still will not work.

Thank you!  
Tammie
