Second try installing SP2. XpPro. Attempting install by using a copy of the SP2 CD and installing from that copy while in SAFE mode (recommended by MS tech support)

I get the following error:

Copy Error

An error occurred while copying file sprb0411.dl_.

Cannot copy file to destination directory.

Click Retry to retry the operation or click Cancel to

that's it.

When I search for sprb0411.dl_, I don't find any such file mentioned on the internet. I assume it's supposed to be sprb0411.dll. That is indicated on fileproperties.com as being an SP2 file.

But no idea how to correct this problem.

Any suggestions welcome.
