Hi,

What port do you need to have open to allow XP SP1 computer to connect to a XP SP2 computer with the firewall on? I can use run (XPSP1 ip address) and access the files, but if I use run (XPSP2 ip address) I can't access the files, unless I turn off the firewall.

I don't know what port it uses when accessing another computers files. My computers that have XPSP2 have no problems accessing other computers with XPSP2 on it, just the XPSP1 can't access the XPSP2 computers with the firewall on. Thanks for any help.

Jeff
