Thanks for the posts.

Sorry about the delay in replying.

I cannot find a way of using runas to escalate the security to allow the administrator to change network connection settings without logging off the user.

I cannot use runas to run ncpa.cpl as it is not a win32 application.

control.exe is but it wont run under runas.

Do you know of a way to either do the network settings changes or run control.exe under runas.

Regards, Major.
