DMA is enabled intel accelarator installed – regedit bit that you quoted – and as I said Nero has no problem at any time recognizing or using either burner windows on the other hand has a problem with recognition – M/P 10 quit recognizing the rw/drives first shortly after installing M/P connect – the support site faq said the M/P would not recognize 2 burners on the same ide so I put 1 on each – compatabilty site had a firmware upgrade for one burner – installed it as per instr. still not recognized by windows – cables are good – I might think it was something like that except for the fact that Nero has no problem ???
