Everything including execution of "arbitrary code."

Search the web for Windows security advisories that include the words "local privilege escalation." These indicate "okay i have a local (restricted) user account, and this hole gives me administrator priv's."

IE is comparatively far more dangerous.

Unpatched Mozilla can still be a big problem though too. You have to keep up on all fronts. Mozilla was also vulnerable to the malformed graphic buffer overflow, but its security track record remains far far better than IE.

microsoft.public.windowsxp.general: Re: How safe is a "Limited" XP account?

It does too many things by default, yes. There are options that need to be disabled there. Try Mozilla Thunderbird for a little more insulation, or investigate all the default options you need to modify to use Outlook relatively safely.

There are more secure OS's out there.

What are your goals? What need motivates your questions?

Best Regards,
