Help!!!

Scenario::

Windows Server 2003 enviornment and ADUC 2003. Set users to power users for XP Pro. I would like to know if anyone has learned how to run everything in the power user's session as administrator. Not just using the run as command for a program but for example, the power user is in a GPO that disables the control panel and the run as command from the start menu. So, if you want to do something within the control panel you have to log off and log back in as a domain admin or local administrator. This takes to long and I would think you could run the current desktop session with admin permissions. Please if any MVPs out there no what I can do... or have any advice in this domain controller environment, please respond!!! I love to hear the knowledge of you Win XP PRO geniuses.
