Using xp prof SP2 and have problems with NIS 2005. After resolving/re-install the NIS, I do windowsupdates customsie method and install all the available ones.. After the downloads, the pc cannot reboot. When I on the pc, it goes as far the the xp logo with the blinking light going from left to right for a while and after that the screen went black and the moniotr light goes from green to orange, and the power of the pc still on. What can I do to get back my system. Please help, thanks

.
