Its not a desktop microphone. I have it hooked up to the mic port, The mic is new and like I posted before I have used it on other systems and it worked. What I was trying to find out if there is a way I can plug it into an device that I usually use the mic for and hook it up to the computer so it reads from the device?
I'm not getting the answers to my questions here it seems I'll have to find out a way or order something else.
