I seem to have a problem I'm guessing with ATI graphics. I am randomly getting the following message –VPU Recover has reset your graphics accelerator as it was no longer responding to graphics driver commands. The display adaptor is Radeon 9550 and Radeon 9550 Secondary.

These other problems may also be related

This one is tied to a message that says that windows encountered a serious problem and had to restart:

System error:

Error code 000000ea, parameter1 81acb5f0, parameter2 819f42f0, parameter3 8219af28, parameter4 00000001.

And also

The driver ati2dvag for the display device \Device\Video0 got stuck in an infinite loop. This usually indicates a problem with the device itself or with the device driver programming the hardware incorrectly. Please check with your hardware device vendor for any driver updates.

I have checked for updates, but the the system indicates that I have the current driver. I also tried disabling the driver and reloading. I have also searched my driver directory for a 8 charactor sys file, per microsoft article 894278 re. microsoftupdate 9trojean) rootkit spyware. I didn't find any hidden drivers fo the type described.

I am running

Windows XP SP2,

AMD Athalon 3200+

WDC WD1600JB-00GVC0

LG Flatron L1910S

.
