Environment: WinXP Pro/SP2 with a Logitech wireless keyboard and mouse. Suddenly, when the mouse position is idle for more than about 10 seconds it is as if the mouse goes to sleep. If I Left Click the mouse it wakes up at the position it was left at? I didn't (intentionally) change any settings? Any thoughts on exactly what setting is causing this? I looked through ControlPanel/Mouse and don't see anything that applies?

Wayne
