THAT'S WHAT I WANT TO ACHIEVE. HOW????

Best Regards,

Matias.

Your video card doesn't have a control panel where you can adjust the brightness? Right click on your desktop/properties/settings/advanced button.

Hello, my problem is the following, I played a dos-game what I found and downloaded somewhere online(nvdr. Celtics vs. Lakers), the controls didn't work, but this is not a problem, I noticed that the brightness of my laptop's screen went down significantly, I have no explication why??

Now it looks like my laptop is on battery-mode(the funny thing is also that if I switch over to battery, that it goes EVEN darker, so there is an interal error somewhere)

This stays after a new start-up, I also switch over to Windows settings that worked before, but screen stays not bright enough.

I looked in my BIOS already, but there is nothing corresponding to screen brightness.

Also not in my settings or energy settings.

On my laptop there isn't an Fn+ shortcut to screen brightness, of this I'm sure also.

Re: screen brightness laptop not Fn-key related??

Could anyone help me, because this just isn't fun anymore.

My best regards,

Matias

Have you tried increasing the brightness?
