Hey Scott,

WOW! That company has no clue of the risks that they are taking. First of all to my knowlege there is only 1 way you can have a network of that size in a workgroup, and that is to have everyone with the exact same logon screenname and password so that they can still share files. Otherwise every single computer would have to have 500 or so entries in their user accounts so that everyone would have permissions and there is no way that is happening. So tell those people to get their network set up in a domain or they will be S K rewed!!! Also, tell the company that they need a new engineer! Good Luck
