Since I didn't get any help regarding this subject (on the two different posts I made) I thought I'd go ahead and play with settings in the Power Options. I found one that for some reason seems to work....I have it set for 15 mins. then shut down the monitor and for today, this has worked.

I have a logitech wireless keyboard and mouse. I thought (based on reading here in the newsgroup) that it may be a sensitivity to the mouse, but I guess not. For whatever reason, it works at the 15mins. point, but no others.
