What Security software (AV, Firewall) do you use ? I've worked a handful of these "Java's There, but the browsers can't load/use it" issues. Also, have you used the Sun Java applet in Control Panel to purge/delete all the Jar cache & other associated files ? Just as a double-check, I'd run Trend-Micro's online test.

<http://www.trendmicro.com/spyware-scan/>

**Has a couple of ActiveX that will need downloading/granting run privileges.

I uninstalled the version I had and then went back to the Java site and re installed the windows version which is the 1.5.0./6 it appears to be the only one suitable for me.

Needless to say the Java test works a dream but sites requiring Java still reject me.

I cannot believe that everybody has these problems otherwise Sun would go out of business.

Frustrating isn't it.

John,

You do not mention if you tried my suggestions.

"Some sites will only work with the Microsoft version of Java, the Java Virtual Machine. Remove Sun's Java, Google for "Java Virtual Machine" and download the version for XP, then install it and see if it works."

Thank you for your comprehensive reply.
I have restored my Security Zone settings.
MS Java VM is still installed, but 2 out
