Platform: XP Pro

About a year ago, I mapped the following folder on my machine, calling it L:, to make easier to open the folder quickly (start, run, L:)

C:\Documents and Settings\Doug\DL

This worked smoothly. Incidentally, I was working in my admin account. I just tried to do the same for another folder:

C:\Documents and Settings\Doug\My Documents\My Music

I get an error message:

The network path C:\Documents and Settings\Doug\My Documents\My Music

could

not be found. Meanwhile, I'm looking right at the folder in Explorer. I entered the path in the same way I stuck it in this message: Copied from

the

Explorer address bar, then pasted into the Folder box in the Map Network Folder dialog.

In my 2nd attempt, I used the Browse button to find the folder. When I highlight the My Music folder, the OK button is greyed out. There are no access issues with that folder – I can perform all file functions while viewing it in Explorer.

Re: Rules for mapping drives or folders

What's going on here?

Surround your paths with double quotes, e.g. "C:\Doc ...\My Music"

Just tried it. Same error message.

.
