I am having the same sort of problem. It all started (or so it seems) when I was setting up and configuring a wireless network at home. I get the following "svchost.exe – Application Error":

"The instruction '0x00a996bc' referenced memory at '0x00000000.' The memory could not be 'written.' "

When I click either of the options ('OK to terminate' or 'CANCEL to debug') the message disappears and I can continue in whatever I'm doing. It does not appear to be affecting any application or process. It just keeps popping up in a fairly random, but all too often. It's driving me nuts!!

What do I do? Would a system restore solve the problem?

I'm having awful problems with Win XP, SP2:

First, I'm having errors that read:

svchost.exe – Application error

The instruction at "<memory address here>" referenced memory at "<memory address here>". The memory could not be "written"

Click OK to terminate the program.

Click on Cancel to debug the program.

This happens after an install/uninstall of a program, at startup, and possibly other random undocumented times.

ANY HELP?!?!  
.
