xmodem and zmodem are modem file transfer protocols. Click Start, Programs, Accessories, Communications, Hyper Terminal and have at it.

Bob wrote:

It is an internal modem. I have a whole technical specification document from BCBSGA, but I don't know much of what to do with it. For example, it says the modem must be XModem or ZModem. How would I know that? There are different log on commands and I don't know what to do with them. All I've ever done with a modem is to dial a phone number. :)
