I appreciate you response. I did not intend to go deep in the subject, but it looks like I must in order to learn how to convert MS Word to one of the files listed in order to produce an URL.

Valid file types for URL: gif, jpg, jpeg, png, bmp, swf

To produce a URL? What are you really trying to do?

A URL is simply an address in a form that a browser can use. It contains (sometimes by default) the protocol to use, the domain to connect to, and a path to the document or resource to be retrieved. That resource can be an HTML file, an image file (with any of the extensions you've listed), an audio or video or any other kind of file you can imagine. Or a request for the server to run a program or access a database and return a file. "<http://www.microsoft.com> is a URL. If you type it into your browser, the browser will retrieve an HTML file which will tell it to retrieve a stylesheet, several images, maybe some other things.

If you want to distribute a word document, you could simply distribute it in that format, or convert it to HTML or PDF. Converting it to an image would about the worst possible way to distribute it.

If you tell us what you're trying to accomplish, we might be able to suggest ways to accomplish it.
