Yes, I can hack registry and replace that Place(n) value of REG\_SZ type in [HKEY\_CURRENT\_USER\Software\Microsoft\Windows\CurrentVersion\Policies\cmdlg32\Placesbar] with new DWORD 0x00000012 value. Then I also can see the "Entire Network" icon in the "My Network Places" filelist.

But "WindowsXP Group Policy Editor" seems to accept only strings there.

Correct. AFAIK, the "WindowsXP Group Policy Editor" creates REG\_SZ type entries only within that key and does not take advantage of REG\_DWORD or REG\_EXPAND\_SZ.

I would like to know what is the mnemonic-constant/file-path in "WindowsXP Group Policy Editor" to be entered, so that "Entire Network" icon will also be visible in the "My Network Places" filelist among other items?

No way – you may want to use "TweakUI" instead.
