From: "Simonel" <simonelvladtepes@xxxxxxxxxxxxx>

| My computer refuses to do the pull down menu on the Internet Explorer
| address line and on Word Perfect "File" tab. The WP problem
| disappears once I sweep with webroot adware removal software, but it
| keeps coming back. Lately, when I try to access some web sites a window
| pops up requesting my username and password, yet rejecting any
| combination I try, something that does not happen at my computer at
| work (the same web site does not request username or password). It
| seems I have a problem with a malicious adware or virus. I already have
| McAfee, which never detects any viruses, and 2 adware removal
| softwares: webroot and a Swedish program called adware SE plus (all 3
| are regularly updated). Any recommendations for any other adware
| removal programs? – Simonel
