Hi! I've recently installed a new motherboard, ATI Radeon graphics card and memory into my XP system, and now I can't seem to load anything!! I've looked on the web and the problem seems to be with the motherboard. Not only that, but the BIOS is... scrambled... its in English, but half the letters aren't right. O's get replaced with G's, so it can be quite hard to make out the BIOS. Is this faulty?

90% says incompatible or defective video card.

The rest is divided between other compatibility issues with the motherboard (ram/ processor, power supply), and a plain defective motherboard, and a short.

Once you solve the BIOS issue, we'll see what happens with windows

.
