Hello,

I'm running a defrag on a notebook with a 30GB capacity & 21GB free and Windows XP Pro SP2 and it's been at 22% for two hours and it's stating it's moving file – REGISTRY\_MACHINE\_SOFTWARE for a while now. When I check Task

Mgr, it states defrag is still running and the CPU is running at 100%.

However, the HD light isn't blinking. Should I be more patient or is there a problem I should be aware of?

Thank you.

Stop the process, restart in safe mode, and then run defrag.

Deactivate the virus scanner, in particular, and try another defrag program like O&O Defrag.

Roy
