I have a new system with XP Pro SP2 and have setup one user ID with Admin privileges. When I start the system I receive a logon message "The system could not log you on. Make sure your user name and domain are correct, then type your password again. Letters in passwords must be typed using the correct case." Behind this message is the classic Log On to Windows box with Administrator in the User Name box and grayed out. When I click OK in the logon message dialog the screen changes to the normal XP logon screen with my user account listed and I can click it and login to that account. The system is not on a Domain and will be setup for a workgroup.

If I remove the password from the Administrator Account the system automatically logs in to that account and never gives me the login screen. I haven't run into this problem before and the Administrator account usually only comes into play on the login screen in Safe Mode.

Hope you can help.

TIA,
Gregg
