I followed your procedure and I didn't need to login on reboot. But I lost all of my computer settings, desktop, email, folder settings and a many more things. Then I followed your procedure again and selected my account and didn't enter any password as I never have used PW. Rebooted my computer, never had to login so worked out good. Maybe I missed something on your procedure - I sure didn't want to lose my computer settings. Got all back so worked out good. Thanks

Frank,

You can setup automatic logon without removing the additional user accounts.

Follow these steps:

Click Start, Run and type CONTROL USERPASSWORDS2, and click Ok. The built-in

Administrator account is highlighted by default, in the dialog. So, you need

to select the user account from the list (the account to which you want to automatically logon). Uncheck "Users must enter a user name and password to

use this computer" option, and click Ok. Type the user account password and

complete the process.

I would like to know how to remove my administrator account so I don't

Re: Windows xp Prof remove Administrator acct

have
to login on boot up. I am the only person who uses this computer.
