Hi

Read this lot, if you have not already – you are not alone.

Once again it appears that another bunch of updates are causing havoc???

I am waiting till the dust settles – got enough problems from some of that April load of cxxp downloads.

After installing the patches that came out on 13 June 2006, I was unable to reconnect to my ISP after I rebooted. I kept getting an "Error 718"
I loaded a second computer with Windows XP SP2 without any security patches installed. Installed my PCI modem and drivers. Setup my DUN and was able to dial out and successfully connect to my ISP. I download & installed every security patch from Windows Update, rebooted and tried dialing out but got the Error 718. I then rolled the computer back to the beginning restore point and dialed out successfully. After several hours of installing a security patch, rebooting, and dialing out, I found that KB911280 was the cause of my problems. I uninstalled this patch and was able to dial out and connect to my ISP. I can replicate this error on any computer just by installing KB911280.

Did you check your connection settings? I found that I had to redo mine. My local proxy settings and some of the Advanced & Security settings in IE had been reset. I was wondering what had done that.
