I think you need 2 VPNs, one each way.

So you need you home router to work as a pptp client to the linux box too.

acon wrote:

I need to conect my home network with mi office network.

At office, i have a linux machine acting as a router.

At home, i have a ADSL router and 2 XPpro machines.

The network at the office is not conected to internet, but to a VPN provided by the ISP that connects all sites in the same subnet.

This means i cant map nat ports to my server, so y cant use IPSEC.

The only way is PPTP.

I have succesfully conected the Linux server (pptp client) to my home router (pptp server) and the link is working fine.
