Can't he use a login batch file, that's uses the reg.exe command, for each existing user account? The batch file could be placed on a server and accessible by all.

Well, it says:

Templates have the following limitations:

- .Policies are limited to the settings available in the HKEY_LOCAL_MACHINE and HKEY_CURRENT_USER registry subkeys.
- .You can't reference a registry key that requires binary data.

Therefore, we'll rule out the ADM option. Other option is to use a logon script (regedit.exe /s filename.reg), but it runs under user privileges, requiring user access to regedit.

Also try the question in the following groups to learn if there is a method available:

microsoft.public.windows.group_policy
microsoft.public.win2000.group_policy

Steve,

Option 3 may be what you're looking for.
