Download AUTORUNS from www.sysinternals.com. This will not only show what apps are auto started, but what HOOKS are in your system, especially in areas that msconfig does not show, e.g., Browser Helper Objects (BHOs), Appinit_DLLS, Winlogon, ...

You can always turn on Windows XP Logging, reboot and then later look at the log to see what is actually started when the system starts.

HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon

UserEnvDebugLevel DWORD 300002

this will create a file under C:\Windows\Debug\UserMode\userenv.log

After you reboot and the login has been performed, set the value to 0

Ok so my friend asked me to look at her computer to see if I could repair it, well turns out she had a lot of viruses on it, some really nothing some medium well there is 2 iexplore.exe's running in taskmanager and I can't stop the process's. I looked everywhere to find help and so far I got nowhere.

I ran hijack this and came back with a couple of files such as "Polymorph.dll, dvb03a.dll" that I tried to delete them but they come back, and not do they only come back I can't find them in the location hijack this says they are at.

Has anyone had this problem with the iexplore before? Again I tried autoruns, hijack this, cwshredder, norton anti-virus, a-squared with no results. I really don't want to reformat the computer. So any advice??
