Okay good. So how come I can delete them One at a Time or in Smaller Groups? This is what I'm confused about.

BTW: Before replying to this, I ran a second instance of Search (for the same files as the First Instance). Obviously they would be the same. I then went back to the First Instance, deleted one file and the Second Instance dynamically updates itself (which is what I would expect). However, Group Deletions (in Either Instances) reported the same message. So, being as diligent as possible, I went to the Second Instance of Search, re-ran it and the file list was identical to the First Instance.

In the First Instance, I deleted a file – the Second Instance updated Dynamically. BUT, "Group Deletes" still report the same error.

Hmmm – you see my delima?

Thanks,

Wiley.

Your trying to delete from the temp directory – if you can' the file is in use or has been deleted since the search was perform'd, and it stops the whole process
