I am running an AMD 64 3200+ w/1GB memory and SP1, updates complete. I

have

had this computer for almost two years and no problems (except SP2 which I removed).

I installed the Wal-Mart photo program in order to send in pictures for printing, then pick them up at Wal-Mart. However, my pictures were too large, over 5 MB per, and the program stated they were too large. So I uninstalled the program. Now whenever I boot, the Windows Search program starts running. To merely click the x for close the file only starts more Searches to open. The only way I get it to stop is to use the Control+alternate+delete, then stop program.

I've attempted to restore from the previous day to all the way back to

last

week without success.

I have completed the anti virus (up to date) scans, and ran anti spyware

with

no luck.

I have also gone to the Help files at the Microsoft site. Nothing there (that I could find).

Looking for some help please.

Thanks

Click Start / Run / msconfig.exe {OK}, then click the Startup tab and untick the Search program.
