I've read so much differing stuff across the past few months about what restore points do, and don't do, –
I haven't a clue as what actually happens !! ..beyond "...critical system files and other changes are restored..." !

...I understood that the registry is only fully restored to a previous version, if one uses the Microsoft backup program "system state" feature, and that that's about the only thing of use in the MS backup program. Also MS backup is installed for use in the retail version of XP Home but, you have to dig it out and install it oneself in OEM versions.

I played with MS Backup system state for a while, a while ago but, abandoned it for Ghost.

...I think Ghosting is best – one is able to restore the lot !

I thought a System Restore got rid of all new registry entries, that is why Mycrosoft recomend creating a restore point before installing new software.

Re: nero 7 registry cleanup...

Can anyone point me to a registry clean up utility, (if one exists at Nero), that will clean up the seemingly myriad registry entries left behind in my registry, – after installing Nero 7 30 day free trial / trying it for a few days / and then "uninstalling" it and reinstalling my "free" Nero 6 that came bundled with a DVD rewriter ?

Why is it that almost all software houses supply an "uninstall" that only does a fraction of the job required to COMPLETELY uninstall their program ??

I should have made the effort to Syamntec "ghost" my drive before installing the trial, or at least created a XP "system state" backup so that I could dop my system and registry back to how it was before installing Nero 7 trial but, there you go !!!!
