This flaw too (Dehibernating freezes the PC when TWO usb modems are plugged) is fixed by hotfix 909095. It must have been another consequence of the initial bug ("when you upgrade RAM to high size – 1Gb or 2Gb –, XPSP2 fails to enlarge accordingly the pagefile"). FWIW,

Subject: Dehibernating freezes the PC when TWO usb modems are plugged

....the 2nd flaw above (PC getting frozen when dehibernating) consistently comes when *TWO* (external) USB modems are connected, and consistently *DOESN'T* come when *ONLY ONE* USB modem is plugged...

.....
