A couple of questions:

1. Can you ping the name `aaa.ccee.rrr.cc.com`?
if not then check the DNS server for the proper entry.
2. If #1 is ok then is there a web service running on port 51000 on this host?
if not then check the web service on the host

Hi all,
I m facing the following problem and I can not fixe cause everything seems ok! I m using XP Pro
Thanks four help,
FF

The requested URL could not be retrieved

While trying to retrieve the URL:
<http://aaa.ccee.rrr.cc.com:51000/rep/start/sso/Repository.jsp>

The following error was encountered:

Unable to determine IP address from host name for `aaa.ccee.rrr.cc.com`
The dnsserver returned:

Name Error: The domain name does not exist.
This means that:

Unable to resolve the hostname presented in the URL.
Check if the address is correct.
