I tried all the steps you mentioned. Didn't work either. I uninstalled all my applications too, but still the same result

I'm sorry that I was unable to help you then. Test your hardware and if it is all healthy, do a clean install of Windows. Do not put the machine on the Internet until it has SP2 (if your XP install is pre-SP2) and the Windows Firewall is active. Install drivers one at a time, testing after each install. Use drivers from only a trusted source. Go to Windows Update and install updates one at a time, testing after each install. Install programs one at a time, testing after each install. Use program install executables only from a trusted source. Install a current version (not earlier than 2005) antivirus and update its definitions. Scan your data backups before copying data to the hard drive.

Or take the machine to a professional computer repair shop (not your local version of BigStoreUSA). There is no shame in doing this.

Good luck,

Malke
