Again, without much info, I'd definitely check your memory. Sounds like a problem that drove me nearly mad recently. Good luck.

Hi everyone,

Has anyone had this problem? This is the first time I have encountered this.

My computer will be booting up, and right when it is about to go into the Windows XP loading screen, there will be a brief flicker of a blue screen (like a fraction of a second), but then the computer will automatically restart itself and begin the process again. It gives me the option to start the computer normally, start with the last known good configuration, or start up in safe mode (with/ without networking), it doesn't matter which option I choose, the outcome is always the same -- it reboots itself.

Any ideas??
