Need clarification...

For some reason my new toshiba laptop doesn't synchronize
it's clock
properly.

Can you explain how you have determined this?

My old toshiba (both using windows XP) syncs whenever I
establish an internet connection.

Again, how are you determining that?

This version of XP, apparently multi media version of some
kind

Do you mean "Media Center"?

will sync on demand

How do you demand it?

Re: time synchronization

but then it schedules sync time.

Where? Where do you see this schedule?

On another note, what's the deal anyways? I thought these computers had a cmos battery that kept track of stuff like system clocks and what not.

They do. What makes you think that your does not?

-Frank

How do I know my clock is off? Because the time that is displayed in my taskbar is inaccurate. If you double click that, you open your time settings (or if you go to your control panel and click time settings you get the same dialogue box). There you can set your date and time, time zone, and internet time options. In the internet time options box you can select automatic synchronization. I know that it is scheduling a time for synchronization because it says so, it tells you the time and date of the next synchronization. If
