Windows Genuine checks are based on the motherboard components. Since you have changed it, the WGA fails. You need to re-install XP (or do a repair install on top of the installed one) in order to "reset" the WGA info. Of course this required a new activation.

I recently upgraded a computers motherboard, processor, video card, and powersupply.

I put everything in correctly and then when I went to start the computer it got to the splash screen and then gave me the "Blue Screen of Death". When I restarted the computer in safe mode it gave me an error saying that I dont have a genuine copy of windows.

The operating system was fine before I upgraded the computer, I didn't do anything to the hard drive, and it is a lagite copy of windows XP home edition.
