SSDP Discovery Service is only needed for WMP if you have some sort of Portable Media Device.

Open Services...

Start | Run | Type: services.msc | Click OK |

Scroll down to and double click: SSDP Discovery Service |

On the Log On tab, Local System account should be selected |

Allow service to interact with desktop should NOT be selected

Allow service to interact with desktop

[[Specifies whether the service provides a user interface on a desktop that can be used by whomever is logged on when the service is started. This option is available only if the service is running as a LocalSystem account.]]

SSDPDRV should be started by LocalService.

The Local System account is a predefined local account that can start a service and provide the security context for that service. The actual name of the account is NT AUTHORITY\System.

The Local Service account is a special built-in account that has reduced privileges similar to an authenticated local user account. The actual name of the account is NT AUTHORITY\LocalService.

SSDP Discovery Service = SSDPDRV

To display the WIN32\_EXIT\_CODE error that SCM encountered when trying to start the program, at the command prompt, type:

```
sc query ssdpsrv
```

See this...

ID: 7000
