Why is this
happening
& how do I
change the
screen
resolution
to
1024X768?

Either your video card won't
support the higher
resolution, or your
monitor won't.

Is there any way by which I can find out
whether the video card
doesn't support it or is it the monitor that
doesn't support it?

Re: Screen Resolution

Irrespective of whether the video card is the culprit or the monitor, is there any way by which I can make culprit support 1024X768 (of course, other than buying a new video card or a new monitor)?

You do not state if it had been previously set at the higher resolution

No, AJR, I have never ever set the resolution to 1024X768.

Thanks to both of you for your responses.

Since the adapter had that resolution as an option on its slider, I suspect the adapter can handle the resolution. You might try changing the screen refresh rate under the Monitor tab, and see if the new settings will be accepted.

Joe, you have hit the nail on the head. I changed the monitor refresh rate from 70 Hertz to 60 Hertz & now I am being allowed to use the 1024X768 screen resolution but the problem is when I change the refresh rate to 60 Hertz, the screen goes on flickering (I don't know

Re: Screen Resolution

whether I have used the correct term or not but it's somewhat like how the lights in a pub blinks) at the speed of knots & it really strains the eyes (I am not referring to the screen getting blackened out when Windows implements the changes made in the refresh rate or the screen resolution). This doesn't happen if the refresh rate is set to 70 Hertz or more.

Is there any way by which I can stop this flickering of the screen when the refresh rate is set to 60 Hertz?

Have you tried setting the refresh rate up again, but lowering the color depth?

Ken, I tried it after going through your suggestion but that doesn't make any difference. Any other ideas/suggestions?

Thanks
