Are you part of a domain? Do the domain controllers also have the DST updates applied to them? You could be synching with servers that have their own time incorrect.

Here's one for you:

What if you applied the patch, and see the correct time (and note that it says "Eastern Daylight Time" on the date/time applet) and then reboot?

I find the time displayed is 1hr off (backwards, so it's supposed to be 1:30, but displays 12:30).

So I go back into the Date/Time applet, and find that it says "Eastern Standard Time". Then I hit the Time Zone tab and change to another timezone, and back immediately to Eastern. I make sure the Daylight checkbox is checked. Hit Apply, and the time display correctly again, until the next reboot.

What can I do for this?! A portion of the clocks on my network are displaying correctly, others are showing an hour off. No rhyme or reason to it.

Thanks in advance!

Ken B

Re: DST in Windows

Joe-

Yes, I do have 931836 applied to both DC's. Both DC's are displaying the correct time (currently the time in the taskbar shows 11:53a Eastern Daylight Time).

I was on that track, but the DC's showed the correct time and settings--it's just on the workstations that the time isn't displaying right. It appears that the UTC time behind it is correct--otherwise, the users would not be able to login to their PC's.

Any other ideas?

Thanks

Ken
