I am having a similiar problem. I went through the steps given by Microsoft. I applied the patches to the workstations, to the server, and to Outlook (downloaded the correct patches, so please don't ask that). All of the clocks are 1 hour ahead. If I uncheck the "automatically adjust for dst" checkbox the time is correct. I downloaded tzedit, to check if that might fix the problem. I opened tzedit and the settings were all correct, so I didn't do anything with it. Any ideas????

DSTpatches were applied (KB931836) to my XP PRO machines via WSUS, however we have large number of machines that keep automatically adjusting their time either one hour ahead or behind. We've uninstalled the patch, reinstalled, used tzedit, un-checked the auto-adjust clock and when it finally stops the system time from changing a problem in Outlook persists.

The Outlook clients on these affected machines, both 2000 and 2003. They are receiving emails with a time stamp of one hour behind, despite the time being correct on the source.

We are using a hosted email solution and if we use the web interface from the same machines experiencing this problem, the correct sent and received time stamps appear, which proves the issue is specific to Outlook.

Re: DST Issues w/ XP Pro & Outlook

In summary, my questions are as follows:

What is causing the XP machines from auto-adjusting their time at random despite being patched?

How can I resolve the Outlook issue?

Start here, check off the Windows OS version and click on next to see the software under that OS that has DST patches or info. There are specific patches for Outlook.
