I think I found my problem.

I use McAfee personal firewall 6.1.6144. Before all the updates, the windows firewall was disabled. Somehow it was re-enabled. Now everything woks great with the windows firewall disabled! Don't you wish that when someone changes you windows default settings, they should let someone know? Like the user/owner of the hardware/software.

Let us all stop and pay \$\$\$\$

"Gott" wrote:

The issue here is not that FTP can not be accessed via command line FTP or previously via IE6 even through a NAT router. The issue is that there has been an Windows or a Microsoft update which prevents FTP access regardless of whether you select or deselect passive checkbox or use folders for FTP checkbox. This IE7 update, whatever it is, has also now effected IE6 so it does no good to do an IE rollback. Using a third party FTP browser is suspect because all of them entail an eventual cost. This is the suspicious part of whatever is going on – perhaps a MIP paving the way to make money by selling a browser for FTP or helping a friend to do this.

Thanks Tim for the information.

I bypassed the router last night and verified that "IE7" & command prompt did not work.

Before I posted my first message I verified that passive and active did not work.

I used to use WS_FTP before I started using Windows XP. I think I should

Re: FTP

try
something like that.

If you see any fixes for this "Windows XP" problem, please do not hesitate to post here.
