Hello,

I posted this to a COBOL group and got the suggestion to post here . .
so.

Has anybody had any experience upgrading from an old Windows NT
Thinkpad with VisualAge Cobol V2.2, CICS for Windows V3.1 and DB2 V7.1
to a new platform with upgraded software.

I tried going to a new XP Pro laptop with the old software and the
experience was brutal and failed.

Specifically the Cobol caused all kinds of nightmares. It installed,
programs compiled, but they all failed upon execution with the same
'The application failed to initialize properly (0xc0000005)'.
'

Any suggestions please/thanks.
