This generally has to do with display drivers. If you have recently updated them (especially via MS updates) try a rollback.

Hi there,

I have an XP machine here, and it boots up just into where you see the background and nothing more.

If I press Ctrl-Alt-Del, I can get programs running and the desktop up temporarily by putting "explorer.exe" in the New Task method. Then the desktop will disappear.

I've AVG virus scanned it, SpyBotted, and Ad Awarred it, done Hijack This, all to no avail... Also, I did an SFC/ Scannow and all the files are there.

There's something more to it....what?

Thanks,

Gordon
